

Thermex Trigger Link Module

Item number: 536.99.1000.9

€ 231,85

EAN: 5703347521102

This is how you get balanced ventilation in your home

Many houses today have their own ventilation system with a heat recovery function. These ventilation systems ensure that as much air is blown into the house as is sucked out. In other words, there is a balance in the air exchange. The signal from the Thermex Trigger Link can also be used to activate other installations in the home. When the hood with its own exhaust is switched on, suddenly more air is sucked out of the house than is blown in. A negative pressure is thus created inside the house, and this has the consequence that smoke from the stove or fireplace can be sucked into the living room. Dust and impurities from outside can enter the house and the hood can absorb less well, while it can also be difficult to open doors and windows.

Trigger Link from Thermex ensures that the moment you switch on your hood, a signal is sent to the ventilation system to blow more air into the house, so that a balance is again created in the air exchange. The Thermex Trigger Link is connected between the power outlet and the receptacle, at the same time a connection is made to the heat recovery system.; For connection, please refer to the instructions from the individual provider of the heat recovery system.
